BETA RAVEN
Your Automation Partner

The challenges of achieving product quality and a well-managed production facility make automation a logical choice.

Whether you would like to automate a single piece of equipment or entire facility, our Process Control systems allow you to monitor and control your equipment or processes from computer workstations. The entire process is graphically displayed on the computer. Simply click on a piece of equipment to display and select options.

A Process Control screen allows you to monitor and control your process using simple menus and graphics. Information is updated on the screen in real-time, distinctive colors allow you to quickly identify equipment status.
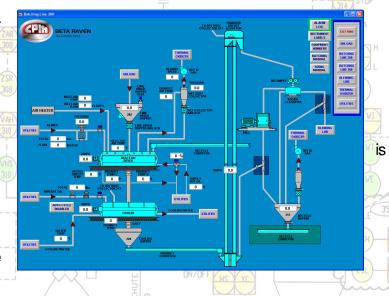

For systems that require data generation and storage, you can store an endless amount of formulae, product, equipment and customer information in our database. Our database is designed for ease of use, allowing you to add or remove information as your facility or processes changes. Data can be easily imported and exported to simplify integration with other systems.

On our standard systems, help is always just one keystroke away. You can quickly access detailed information about database features or control procedures without searching through a printed manual.

Our customer service technicians can remotely troubleshoot your system from our offices via modem and VPN access.
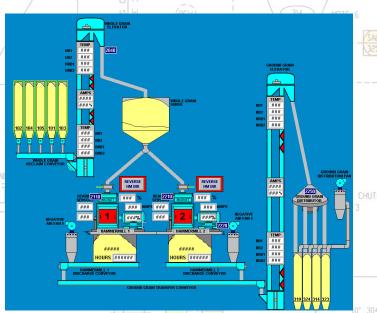

Our systems are built using Allen-Bradley or Siemens PLCs with RSView or Wonderware HMI software.

CPM Beta Raven's family of automation products, services and reputation are the best in the industry, making us the logical choice for your automation needs.
